Functions

1. Write a class Car with:
 - Attributes: brand, model
 - A method `display_info()` that prints brand and model.
2. Create a class Circle with:
 - Attribute: radius
 - A method `area()` that returns the area of the circle.
3. Write a class BankAccount with:
 - Attribute: balance (default 0)
 - Methods:
 - o `deposit(amount)` → increases balance
 - o `withdraw(amount)` → decreases balance if enough funds are available
 - o `get_balance()` → returns the current balance
4. Define a class Student with:
 - Attributes: name, marks (list of integers)
 - A method `average()` that returns the average marks.

5. Calculator

- **Methods:**
 - `add(a, b)` → returns sum
 - `subtract(a, b)` → returns difference
 - `multiply(a, b)` → returns product
 - `divide(a, b)` → returns quotient if $b \neq 0$

6. Employee

- **Attributes:** name, salary
- **Methods:**
 - `get_details()` → prints employee's name and salary

- `apply_raise(percent)` → increases salary by given percentage

7. Library

- **Attributes:** list of books (as a list of strings)
- **Methods:**
 - `add_book(title)` → adds a book
 - `remove_book(title)` → removes a book if it exists
 - `display_books()` → prints all available books
